

**INFORMATION**

The K5600 Multi-Bug Adapter allows you to create a large, powerful, soft source using the inventory you already own or have at your disposal in your lighting package.

Up to (4) Joker Bug-Lites can be arranged within a large Chimera Shallow Lightbank (54" x 72", only 22" deep) or Chimera OctaPlus (5' to 7') with minimal set-up time. That's up to 3200 Watts of output! This provides you with a large, powerful source of HMI quality lighting using the smallest of fixtures.

You can mix and match Joker-Bug 200's, 400's, or 800's to achieve the necessary light levels, and each is individually switchable providing greater light control. Horizontally mount your lightbank from the sky with the K5600 Multi-Bug adapter and now you have the ability to create a "Chicken Coop" Effect with your Jokers.

Set-up is fast and easy with the Multi-Bug adapter. It has (4) standard baby (16mm or 5/8") spigots to hold each of your Joker-Bug's without modification of the fixtures. Each Joker-Bug should run in parallel with the back of the lightbank as opposed to facing forward (toward the screen). If left forward, you'll notice "rings" or "halos" within the lightbank, causing an uneven distribution. Proper positioning of the Joker-Bugs ensures a soft, even, full spectrum light source. In addition, the adapter can attach to any standard baby pin grip item, allowing for endless grip possibilities.

This additional accessory provides one more function to the already versatile Joker-Bug line.
